Show all steps.

Let $\boldsymbol{X}_{\mathbf{1}}, \boldsymbol{X}_{\mathbf{2}}, \ldots, \boldsymbol{X}_{\mathbf{2 5}}$ be independent Poisson random variables with parameter $\boldsymbol{\lambda}=\mathbf{4}$. Use the Central Limit Theorem to approximate

$$
\mathbb{P}\left(\sum_{i=1}^{25} X_{i} \leqslant 110\right)
$$

Your answer should contain $\boldsymbol{\Phi}$. Here you do not have to use the continuity correction.

Here $\boldsymbol{n} \boldsymbol{\mu}=\mathbf{1 0 0}, \boldsymbol{n} \boldsymbol{\sigma}^{\mathbf{2}}=100$ and therefore

$$
\mathbb{P}\left(\sum_{i=1}^{25} X_{i} \leqslant 110\right) \approx \mathbb{P}(100+10 Z \leqslant 110)=\Phi(1)
$$
